

This App is made as per task given to me

1. App uses React.js as frontend to add user information and show all users information on the screen.
2. Node.js is used in Backend to add data received from React Frontend to add information to MongoDB Atlas.
3. Users can Delete their information from the list.
4. I also tried to add an Edit Information function but it is showing errors.

To Run the app

1. In the terminal, In project folder, Run 'npm install' command
2. Change directory to backend folder and Run 'npm start' command
This will start the app.
